Scientific Measurement

The units tabulated in Table II are commonly used in science and engineering. They are primarily chosen from the fields of mechanics and electricity and magnetism and are a representative, not an exhaustive, selection.

SI units are given for all physical quantities listed. For those units having a special name in the International System, the name appears, along with the derivation of the unit from the fundamental SI quantities, which are defined as: meter (m), kilogram (kg), second (s), ampere (A), kelvin (K) or alternatively degree Kelvin (°K), and candela (cd). Two supplementary units, the radian (rad), for measuring plane angles, and the steradian (sr), for measuring solid angles, are used. These are "geometrical" rather than "physical" units, in the sense that their definitions are based on abstract geometrical concepts rather than on physical standards.

In some instances, it is customary practice to measure a quantity in units other than SI units; in such cases the appropriate unit is given in the right-hand column, along with a conversion to SI units.

Additional information on individual units, including those not tabulated, should be sought at the unit names in text.
